

THE GENERAL EXPERIENCE

In this situation of pandemic, where people use to be at home and seems to live the same day everyday, especially for us young guys, through these videos we found out that attention for some themes that in these days are ignored by human society and this take an ecosystem's damage. Thanks to this project we had learns to take care of the nature beside us, we discover how all the things near to us have a specific story that come through the sacrifice of the ecosystem. So, when we watched the videos we understood how protect our world. And how take the best from the utilization of products.

THE MOST INTERESTING POINT

For us it was a fundamental importance the study of the reduction of carbon because especially in this decade is so impressive how the use of CO₂ is particular excessive. Thanks to the unit that talks about the reduction we discover the formation of the acronym CCS (also known as) Carbon Capture & storage which is a technology that involves capturing carbon dioxide that would be emitted into the atmosphere. First, we have been fascinated about the impact of the theme in our society and this make us think about the negative parts that this element could have in our community. So, through these lessons we agree about the diminution of the emission of CO₂ and the protection of the ecosystem for a better air to breathe. We were so interested about this thematic so we search how we can use in other 1000 ways the CO₂ for example: use vehicles powered by synthetic fuels or produce methane and water combined with CO₂ and hydrogen, having an external energy source.

WHAT SHOULD BE BETTER

In our opinion everything that is been dealt in the video is quite complete and useful for all the people who would need it and were not aware of all these things, and it would be even better to be able to share it with more people around the world, to ensure that this project expands more and more and somehow manages to convince people that taking care of our environment is important and it should not be treated superficially, because those who will one day suffer the consequences will only be us. So, to better address these topics and communicate them, it's necessary to spread and enrich the vision, research and knowledge of the circular economy.
